

PRODUCT MANUAL VERSION <98.1>

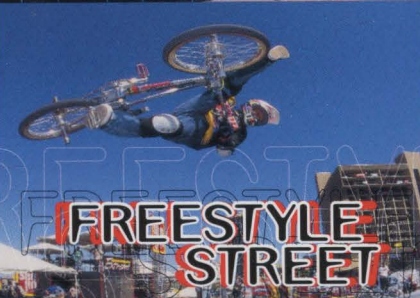

BMX

Haro's history in BMX is legendary. We created BMX's first numberplate and we sponsored its only "Triple Crown" title holder. So it seems only natural that we now have the #1 team in BMX and three World Champions. Every BMX bike we produce incorporates the knowledge we've gained from that experience and the distinctive features that make Haro a winner.

DIRT

Dirt bikes combine the off-road features of BMX with the strength of freestyle bikes. Although the category is relatively new, the knowledge we've applied to it comes from years of experience in BMX and freestyle. For 1998 we've added two models to our line that are designed for and geared toward the dirt jumper: The Supra DLX and the Supra. This will be the bike of choice for Ryan Nyquist who will be competing in the "X" games on one.

FREESTYLE/STREET

Nobody has more experience or more accomplishments in freestyle than Haro. We created the first freestyle bike ever and we're still "first in freestyle." That statement is proven not only by the innovative products we produce but by the way those products perform. And Dave Mirra continues to prove it by winning major competitions worldwide.

ATB

Haro was producing bikes for off-road years before the term "mountain bike" or ATB was created. And while most "big" bike companies think of them as "adult" bikes, Haro thinks of them as bikes for the big "kids." We make em' fun to ride, uniquely styled and built to last with a BMX and dirt bike influence. With three World Cup riders and one demented downhiller, our commitment to mountain bikes is rock solid.

- >RockShox Judy XL fork
- >Shimano XT/LX components
- >Shimano DX clipless pedals

Low-Forward Pivot

There are many schools of thought when it comes to full suspension design. There's active, non-active, Horst links, sweet spots, URTs, struts, beams and who knows what else out there competing for a share of the market. Many require an engineering degree to understand and some require a Swiss bank account to afford.

Haro's low-forward pivot design is uncomplicated but effective. The pivot location forward of the bottom bracket and in line with the large chainring provides an optimum balance between ascending performance and descending performance. Mountain Bike Action described the Extreme's performance this way, "it climbed like a tractor, descended like a deer and generally drew smiles from all who rode it".

Unlike multiple pivot designs, Haro's single pivot is durable, easy and inexpensive to service. You won't need a personal mechanic or a line of credit with your local shop to keep it working day in and day out.

Some URTs or sweet spot designs actually take on the

ride characteristics of rigid bikes when you're descending out of the saddle. The Extreme, on the other hand, descends equally well whether you're in the saddle or up on the pedals.

By positioning the pivot in line with the large chainring, there is a neutral effect on the suspension when you're hammering in the big ring. Biopacing or inch-worming is nearly eliminated providing maximum power transfer at high speeds and on flat sections.

On steep, rough climbs in the small chainring, the rear wheel is actually pulled down and into the ground with the pedal stroke to provide superior climbing traction. The rear swingarm actually digs in to keep the tire firmly planted as torque is applied.

Take a test ride, we think you'll agree that the Extreme's low-forward pivot incorporates an optimum blend of simplicity, performance and affordability.

V-BAR Explained

Haro's trademark V-Bar top tube design isn't meant to dazzle you with technical sophistication. It doesn't reduce wind resistance or improve top speed. It's meant to get your attention, to stand out rather than blend in. It's a bike that doesn't look like 95% of the rest of the bikes on the market.

Aside from the visual aspects of the V-Bar design, there are several tangible benefits that go along with standing out. Like standing over for instance. The V-Bar design provides superior standover height when compared to conventional frames, and that can come in handy during unplanned dismounts.

The V-Bar design also facilitates determining which frame size fits you the best. Conventional bikes are sized primarily based on vertical top tube clearance. With the V-Bar's lower standover height, you can focus on top tube length and choosing the size that best suits your style of riding rather than just clearing the top tube by an inch or two.

The V-Bar is not complicated and it's not a gimmick. It's a design Haro pioneered and one we're committed to. Just look at how many top-of-the-line exotics and full suspension bikes have adapted the concept. We're flattered that everyone thinks it's such a great idea.

ESCAPE A4

SHIMANO
XTR

CODE:

There's only one thing missing on the A4: Excuses. No shortcuts. No compromises. Race it, but remember, with stuff like XTR and the new RockShox SID, you won't be able to blame the bike if you lose.
